

System Workflow Framework

1. User Roles & Entry Points

[Visitor] Register/Login Assigned Role (Owner | Finder)

[Admin] Login Admin Dashboard

2. Then owner report a lost item

Owner logs in

Fills Lost Item Form

(item name, description, color, location, date lost) you have this already

System saves to DB items table (status = "lost")

Item is now searchable by Finders/Admin

3. Finder submits a found item

Finder logs in

Fills Found Item Form

(item name, description, color, location found, date found)

System saves to DB items table (status = "found")

System checks for potential matches with lost items

Admin is notified of new found item

4. Owner can claim

Owner searches found items

Owner selects a matching item clicks "Claim"

Fills Claim Form (proof of ownership description)

System saves to DB claims table (status = "pending")

Admin receives claim for review

5. Admin logs in then views pending claims

Reviews claim details + item description

APPROVE item status = "claimed"

claim status = "approved"

release_record created in DB

Owner notified

REJECT → claim status = "rejected"
Owner notified with reason

Database table

users → id, name, email, password, role (owner/finder/admin)
items → id, name, description, color, location, date, status, user_id
claims → id, item_id, owner_id, proof, status, created_at
release_records → id, claim_id, admin_id, release_date, notes
status_history → id, claim_id, old_status, new_status, changed_by, timestamp

Authentication flow explained by supervisor

User submits login form

Java checks credentials against users table

Session created with user ID + role

Role determines which pages/actions are accessible
(Owner sees lost/found forms, Admin sees dashboard)
